# Raw Data

# Data Integration

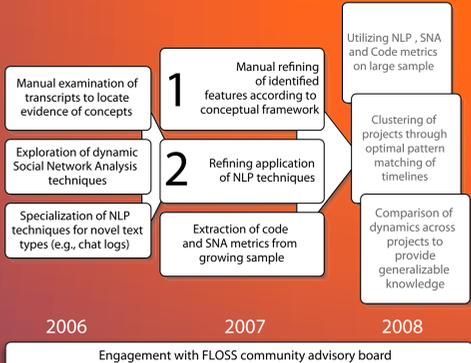

# People

# Investigating the Dynamics of FLOSS Development Teams

What are the dynamics through which self-organizing, distributed teams develop and work? Research partially funded by NSF grant 05-27457, with prior support from 03-41475 & 04-14468

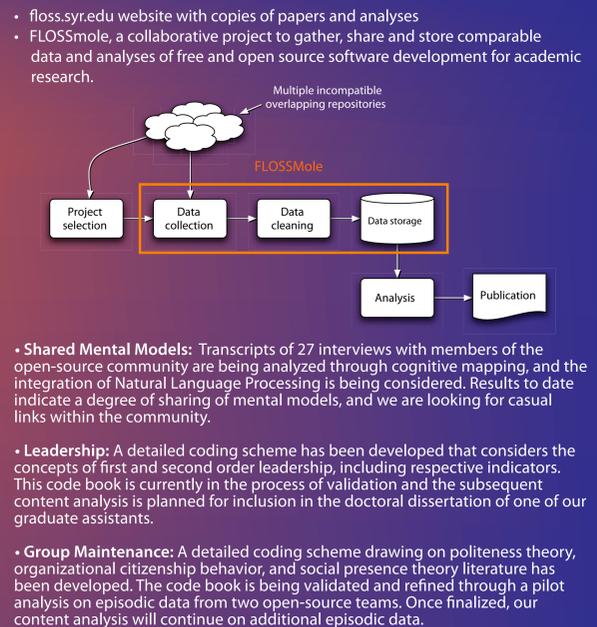

# Research Plan

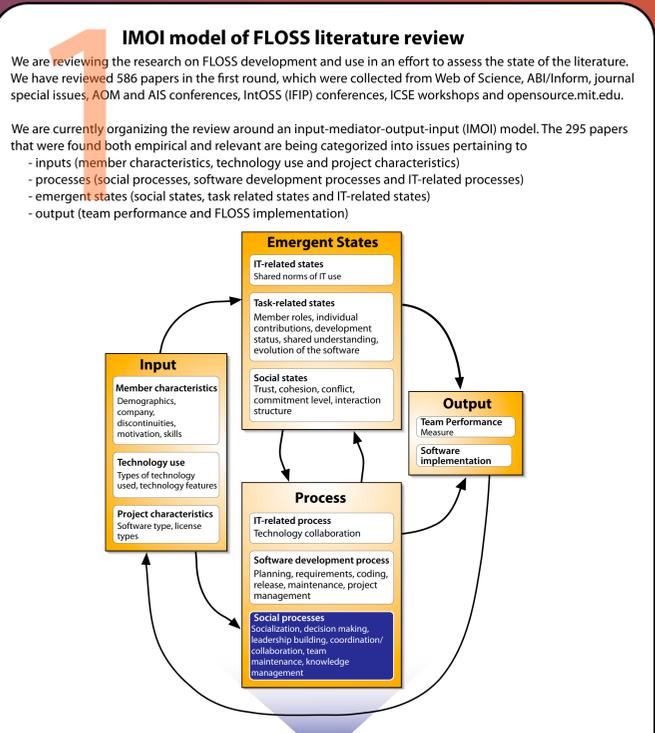

# Key Findings To Date

- We have developed National Language Processing (NLP) text extraction rules to reliably identify 63-72% of decision triggers, and 71-85% of decision announcements.
- There is a positive relationship between the level of participation and group effectiveness, with effective projects exhibiting high involvement from peripheral members.
- Some open-source projects that appear decentralized are actually centralized, but with individuals at the center changing their roles over time.
- In studying shared-mental models, norms and rules are highly shared within groups. However, it seems that tenure in projects can cause those to change within individuals, indicating dynamic processes over time.
- Second-level leadership in open-source teams is enabled by first-level leadership. First-level includes task coordination and contribution, group maintenance, and boundary spanning; while second-level is behavior that influences changes in structure that guides group action.

# Products Plans

- Shared Mental Models: Transcripts of 27 interviews with members of the open-source community are being analyzed through cognitive mapping, and the integration of Natural Language Processing is being considered. Results to date indicate a degree of sharing of mental models, and we are looking for casual links within the community.
- Leadership: A detailed coding scheme has been developed that considers the concepts of first and second order leadership, including respective indicators. This code book is currently in the process of validation and the subsequent content analysis is planned for inclusion in the doctoral dissertation of one of our graduate assistants.
- Group Maintenance: A detailed coding scheme drawing on politeness theory, organizational citizenship behavior, and social presence theory literature has been developed. The code book is being validated and refined through a pilot analysis on episodic data from two open-source teams. Once finalized, our content analysis will continue on additional episodic data.

**Socialization:** What processes do members go through in becoming a part of an open-source team, and how are different levels of membership defined?

**Decision Making:** How are decisions made in matrix environment such as open-source teams where leadership is not always clearly defined?

**Leadership Building:** How is leadership defined in open-source teams, and how do members rise into such positions?

**Coordination/Collaboration:** What are the dynamics of interaction within open-source teams where roles are not always clearly defined?

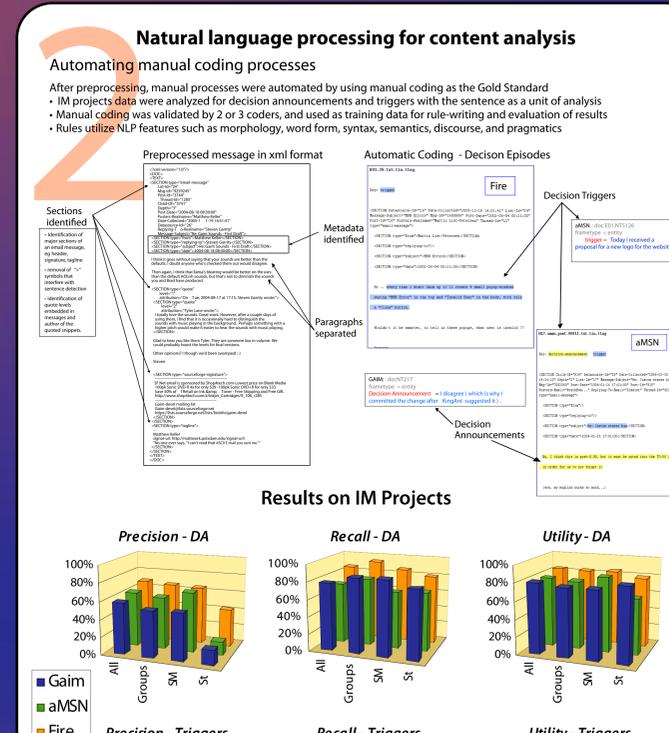

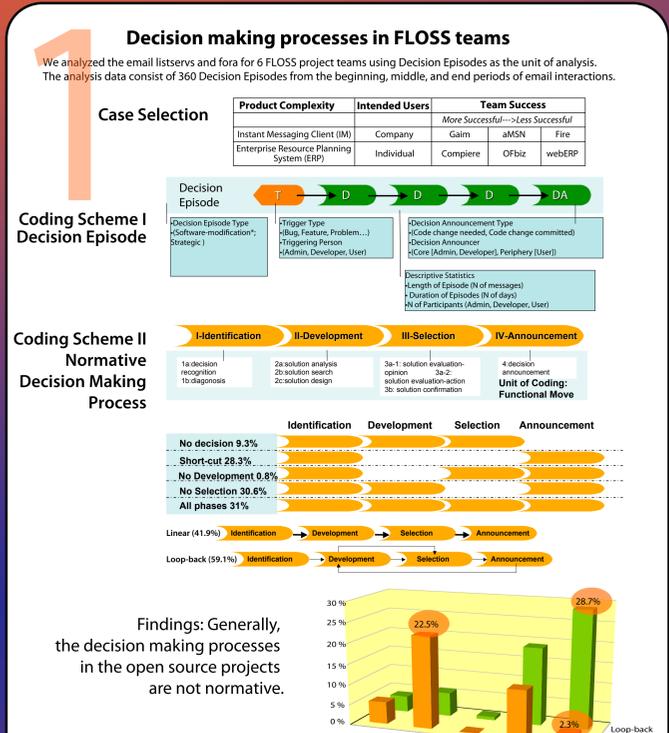

**Team Maintenance:** How do open-source teams form, and what keeps these teams together?

**Knowledge Management:** Where do open-source teams store their group knowledge, and how is it accessed by members?

**Trust:** How is trust formed within open-source teams?

**Conflict:** What types of conflicts arise within open-source teams, and how are such conflicts resolved?

**Level of Commitment:** Considering the often voluntary nature of open-source teams, what amounts of commitment do members invest?
